

Manual Testing Assessment

Web Application Testing — Beginner Level

Practice Sites: saucedemo.com | demoqa.com | magento.softwaretestingboard.com

Student Name:	MD. Arif Uz Zaman Sakib	Date:	12-6-2026
Course / Batch:	18	Total Marks:	50+50=100

Instructions to Students

Please read all instructions carefully before starting.

This assessment contains 12 scenario-based questions divided into 3 sections. Total marks: 100. Time allowed: ***.

Open the live practice websites on your browser during the test. You are allowed to interact with them to observe and verify behavior.

Write answers in your own words. Copying answers from the internet or other students will result in zero marks for the entire paper.

For bug report questions, use the standard format: Title, Steps to Reproduce, Expected Result, Actual Result, Severity.

Marks are allocated per section as indicated. Partial marks may be awarded for incomplete but relevant answers.

Write clearly. Illegible answers will not be marked.

Submit this paper along with any rough work at the end of the session.

Students may use AI tools to assist in answering questions. If AI is used, an additional file must be submitted containing all prompts used during the assessment.

For every scenario/question, students must write and execute at least one relevant test case. Test case quality and execution evidence will be evaluated.

Student need to write and execute at least one test case for each scenario.

For getting 50 marks

Submit the test case in the google drive link within a spreadsheet.

Section A — Functional & Login Testing

Section A — Functional & Login Testing (saucedemo.com)	40 Marks
--	----------

Site: <https://www.saucedemo.com> | Login credentials are provided within each question.

Q1. [3 marks]

Scenario: Open saucedemo.com and attempt to log in using username: locked_out_user and password: secret_sauce.

What message appears on screen? Is the error message clear and user-friendly? What would you log as a defect if it is not?

ANSWER: When you try to log in with locked_out_user, the message "Epic sadface: Sorry, this user has been locked out" appears on the screen. The error message is clear and tells the user exactly why they cannot log in. It is user-friendly because it uses simple words to show something went wrong. Since the message is correct and helpful, I would not log any defect for this. If the message were missing or showed a technical error like "500 Server Error" instead, then I would log a defect saying the error message is not clear for locked-out users.

Q2. [5 marks]

Scenario: Log in as standard_user / secret_sauce. Add 'Sauce Labs Backpack' and 'Sauce Labs Fleece Jacket' to the cart. Click the cart icon.

(a) Are both items listed with correct names and prices?

ANSWER: YES

(b) What 3 things would you verify before proceeding to checkout?

ANSWER:

- 1- Both items are in the cart. Make sure "Sauce Labs Backpack" and "Sauce Labs Fleece Jacket" are both listed.
 - 2- The quantity is correct.
 - 3- The price looks right. Check that the price for each item matches what was shown on the products page.
-

Q3. [6 marks]

Scenario: While logged in as `standard_user`, go to the Checkout page and click 'Continue' without filling in the First Name, Last Name, or Zip Code fields.

(a) What validation messages appear? Are they shown for all required fields?

ANSWER: Error: Postal Code is required,
Yes, they are shown for all required fields.

(b) Write a bug report if the validation is missing or incorrect, using the format: Title / Steps / Expected / Actual / Severity.

ANSWER: Title: Checkout lets you continue without name or zip code

Steps:

-
1. Log in as `standard_user`.
 2. Add one item to cart.
 3. Go to cart. Click "Checkout".
 4. Leave First Name blank.
 5. Leave Last Name blank.
 6. Leave Zip Code blank.
 7. Click "Continue".
-

Expected Result:

You cannot go next. An error says "First Name is required".

Actual Result:

You go to the next page. No error message shows up.

Severity: High

Q4. [6 marks]

Scenario: Log in as problem_user / secret_sauce and browse the product listing page.
--

Identify and document at least 3 visual or functional defects you observe. For each defect, state: what is broken, what the expected behavior should be, and the severity level.

Section B — UI & Form Validation Testing (demoqa.com)

30 Marks

Site: <https://demoqa.com> | No login required.

ANSWER: Defect 1 – All pictures look the same

What is broken: Every product has the same picture. It is a dog with a ball. The pictures should be different.

What should happen: Each product should have its own picture. The backpack should show a backpack.

How bad is it: Medium. It looks wrong but you can still shop.

Defect 2 – Backpack is already in cart when you log in

What is broken: When you first log in, the backpack already says "Remove". The cart shows 1 item. You did not add anything.

What should happen: No items should be in the cart. The backpack should say "Add to cart".

How bad is it: High. It confuses the user.

Defect 3 – Remove button does not work

What is broken: You click "Remove" but the item stays in the cart. You try again and it still does not work.

What should happen: Clicking "Remove" should take the item out of the cart. The button should change back to "Add to cart".

How bad is it: High. You cannot empty your cart.

Q5. [4 marks]

Scenario: Go to demoqa.com → Forms → Practice Form. Click the 'Submit' button without filling in any field.

Which fields show a validation error? Are there any required fields that do NOT show an error? List your findings clearly.

ANSWER: Fields that DO show a red validation error (required):

- First Name
 - Last Name
 - Gender (no option selected)
 - Mobile Number
-

Fields that DO NOT show an error (auto-filled or have default values):

- Date of Birth – shows today's date automatically. No error.
 - Hobbies – no error (but also not selected).
 - Pictures – no error (not required).
 - Address (Current Address) – shows a green tick (maybe auto-filled or treated as optional).
-

Fields that show no red or green (neutral):

-
- Subjects
 - State and City
-

Conclusion: The required fields (First Name, Last Name, Gender, Mobile) correctly show errors. Other fields like Date of Birth are auto-filled, so no error. Subjects and State/City are not marked as required, which matches expected behavior.

Q6. [4 marks]

Scenario: Go to demoqa.com → Forms → Practice Form. In the 'Mobile Number' field, type the value: abc!@#

(a) Does the field accept this input or reject it?

ANSWER: Reject

(b) What is the expected behavior for a mobile number field, and is this a defect? Explain why.

ANSWER: A mobile number field should only accept numbers (digits 0-9). It should not accept letters, symbols, or spaces. It should also check that the number is exactly 10 digits long (for Indian or many other formats). If the user types less than 10 digits or types letters/symbols, the field should show an error message like "Please enter a 10-digit mobile number".

Q7. [4 marks]

Scenario: Go to demoqa.com → Alerts, Frame & Windows → Alerts. Click the button that opens a JS Alert, then click OK.

Does the page update correctly after dismissing the alert? What would a bug look like in this flow? Describe one positive and one negative test case for this feature.

ANSWER: Yes, the page updates correctly. After clicking OK, a line says "You selected OK". A bug would be no new text or wrong text.

Positive test case: Click OK → see "You selected OK".

Negative test case: Click Cancel → see "You selected Cancel".

Q8. [3 marks]

Scenario: Go to demoqa.com → Elements → Web Tables. Add a new record, then edit it, then delete it.

After each action, does the table reflect the change immediately? List 2 edge cases you would test for the 'Add Record' functionality.

ANSWER: Yes, after each action (add, edit, delete) the table updates right away. You see the new record, the changed record, or the record gone.

2 edge cases for 'Add Record':

Add a record with all fields empty – Click submit without typing anything. The table should show an error or not add a blank row.

Section C — Mobile App Testing (30 Marks)

Q9. [3 Marks]

Scenario: [Download](#) and install the latest Android APK of My Demo App RN. Launch the application for the first time.

<https://github.com/saucelabs/my-demo-app-rn/releases>

Tasks:

1. Does the application launch successfully without crashing?

ANSWER: The application crashes only on the first launch. Subsequent launches work as expected. However, after the application remains idle for a few minutes, it crashes again on the next launch attempt. Any launch immediately following that works normally.

2. Are all major navigation menus and tabs accessible?

ANSWER: Yes

3. Identify and document any UI or functional issue you observe during the first 5 minutes of exploratory testing.

ANSWER: When a product offers multiple color options, selecting a different color does not update the product image to reflect the chosen variant.

Test.allTheThings() T-Shirt

\$15.99

Q10. [6 Marks]

Scenario: Log in using a valid test account and browse the product

catalog. **Tasks:**

1. Verify whether product names, images, and prices are displayed correctly.
2. Add two products to the cart.
3. Verify cart count, item details, and total amount.

Questions:

(a) What validations would you perform before proceeding to checkout?

ANSWER:

- Cart items count – Does the cart icon show the correct number (e.g., 2 items added)?
- Item details – Are the correct product names, images, and prices shown in the cart?
- Quantity and total price – If you change quantity (e.g., from 1 to 2), does the price double correctly? (In your case, it does NOT – that is a defect.)
- Color selection – If a product has colors, does the cart show the chosen color? (In your case, color selection is broken.)
- Total amount – Is the sum of all item prices correct?

(b) Write one positive test case and one negative test case for the Add-to-Cart feature.

ANSWER: Done in spreadsheet.

Remove Item

Q11. [6 Marks]

Scenario: Test the application under different mobile conditions.

Tasks:

1. Rotate the device between Portrait and Landscape mode.
2. Minimize the application and reopen it.
3. Disable internet connectivity and attempt to load product data.

Questions:

(a) How should the application behave in each scenario?

ANSWER: When you rotate the device from portrait to landscape or back, the app should automatically adjust the screen layout. Buttons, text, and images should fit the new shape without cutting off or becoming blank. When you minimize the app (press home button) and then reopen it, the app should bring you back to the exact same screen you were on – same product, same scroll position, same items in cart. When you turn off Wi-Fi and try to load product data, the app should show a clear message like "No internet connection. Please check your network." It should not allow adding new items to cart or should store them offline for later. The app should not crash or freeze.

(b) Identify any defects or usability concerns.

ANSWER: There are two main defects. First, the app does not support screen rotation at all. When you turn the phone sideways, the screen stays the same and does not rotate. This is bad because users expect apps to work in both orientations. Second, the app works perfectly fine even when the internet is turned off. You can still browse products, scroll, and add items to cart without any error message. This is a big problem because users might think they are online and later lose their cart data when the connection returns. The app should warn the user and disable actions that need the internet.

(c) Write a bug report using:

ANSWER:

Title: App continues to work fully without internet – no error message and allows add to cart

Steps to Reproduce:

- Open the app with the internet on.
- Turn off Wi-Fi and mobile data.
- Browse products, scroll down, and tap "Add to cart" on any item.

Expected Result:

The app should show a red or yellow message saying "No internet connection". The "Add to cart" button should be disabled or tapping it should show an error.

Actual Result:

The app works exactly like it has internet. No message appears. You can add items to cart and

see them in the cart screen.

Severity: High
